"You talk. It cuts." An agentic reel editor concept for iOS, built around a multimodal agent that edits a typed timeline instead of raw footage.

▸Native Swift iOS ▸Gemini-powered agent ▸English + Hindi ▸Max 90s reels

The product vision

Eliminating the mobile editing timeline. Creators record raw footage, describe what they want in plain language, and a multimodal agent directs, cuts, reframes, and produces a finished vertical reel.

Confidential concept proposal

Problem statement

High freelance editing costs and tedious manual tools keep solo creators from scaling.

₹500–₹1,000

Prohibitive editing costs in India

A freelance reel editor charges **₹500 to ₹1,000 per video** in India. A solo creator publishing 20–30 reels a month to grow spends **₹10,000 to ₹30,000 every month**, out of reach for students, beginners, and micro-influencers.

2–3 hrs

The manual editing tax

Self-editing a 45-second reel takes **2 to 3 hours**: trimming silences, aligning captions word by word, centering face crops, scouring meme archives.

6-inch screen

Clunky mobile editing UX

Desktop NLEs are overpowered for rapid vertical output. Mobile editors force creators to pinch, split, and scrub millisecond audio boundaries with a thumb on a six-inch screen.

Consistency gap

Creator burnout & stagnation

Social algorithms reward daily consistency. When each video costs hours of scrubbing or hundreds of rupees, creators burn out and post intermittently.

Chat in. Reel out.

ClipZ is a Swift iOS app with an agentic editing core. No timelines, just conversation.

Core concept: no timelines, just talk

Creators shoot raw vertical footage and describe what they want in natural language. The agent handles the rest.

native iOS + cloud agent

AI director agent

Translates creator voice prompts into a structured, validated timeline (EDL).

- → plan_edit()
- → ask_user()
- → get_timeline()

Smart silence cuts

Silero VAD removes pauses and dead air, snapped to real word boundaries.

- → remove_silence()
- → remove_fillers()

Auto meme & B-roll

Identifies jokes, claims, and punchlines from the transcript to enrich storytelling.

- → auto_visuals()
- → insert_meme()
- → auto_sfx()

Face track & captions

Keeps the speaker centered and viewers hooked with animated, word-by-word text.

- → reframe_9x16()
- → add_captions()

Brain, voice, memory, hands.

A hybrid edge-and-cloud stack built for iOS responsiveness and deterministic media output.

CLIENT	**Swift 6**	Native stack for responsive gestures and on-device processing: zero-lag local playback, speaker tracking, low-latency speech capture. `SwiftUI` `AVFoundation` `Metal` `CoreML / Vision`
INTELLIGENCE	**Gemini 3.8 Flash**	Multimodal reasoning for intent parsing, word-level forced alignment, and a visual critic that inspects rendered frames. `WhisperX` `Silero VAD` `typed tool calls`
MEDIA	**FFmpeg 7**	A deterministic, frame-accurate renderer. No model- or user-written string ever reaches a filtergraph unvalidated. `libass` `OpenCV` `ElevenLabs`
BACKEND	**FastAPI**	Asynchronous microservices with live event streams, an immutable version tree, and a distributed render queue. `WebSockets` `TimescaleDB` `Redis + Arq`

Core principle: the LLM edits structured JSON, never a raw shell string.

Architecture overview

A closed-loop agentic workflow: raw capture to a verified 1080×1920 export.

01
Swift iOS client
Raw 9:16 video + voice command

→

02
Ingestion & analysis
Whisper transcript + Silero VAD

→

03
Director agent
Gemini Flash plans edits into timeline JSON

→

04
Media renderer
FFmpeg + libass + memes & SFX

→

05
Critic & export
Visual quality check → 1080p MP4

Strict safety gate

The LLM never writes shell commands or raw FFmpeg filters. It edits a strongly typed timeline, so an unvalidated filter injection isn't possible.

Instant undo / redo

Every agent action creates an immutable timeline version in TimescaleDB. Reverting an edit is a zero-cost pointer move.

```
export(monetized=true)
refused: 1 meme is personal-use only
→ swap the asset, or export as personal use
```

Business model

Disrupting freelance editing costs with recurring, high-margin SaaS economics.

The economics for a working creator

Freelancers: **₹15,000–₹30,000/mo** for 30 reels vs. **ClipZ Pro at ₹899/mo**

saves >95% monthly

Free

Viral growth tier, for beginners testing the waters

₹0 / month

3 exports/month · auto silence & filler removal · standard captions · ClipZ watermark

ClipZ Pro MOST POPULAR

Flagship tier: direct freelancer replacement

₹899 / mo · $14.99

Unlimited 1080p & 4K exports, no watermark · autonomous meme & B-roll · "my style" memory · multilingual captions · priority render queue

Studio / Agency

For production houses and teams

₹2,999 / mo · $49

Multi-seat collaboration · custom brand kits · batch processing · direct publish · dedicated support & API

Unit economics: estimated compute cost <₹10/reel, 75%+ gross margin target

Thank you

Democratizing production-grade video for every solo creator.

> **“You talk. ClipZ cuts.”**
>
> Video creation should be about ideas, not editing friction. We want any creator with a smartphone to publish high-retention content at the speed of thought.

PROPOSED ROADMAP

Q1 — iOS prototype & edge ML
Build the SwiftUI recorder, benchmark on-device Silero VAD and face tracking.

Q2 — Agentic media engine
Implement the FastAPI microservice with the Gemini Flash director and FFmpeg renderer.

Q3 — Closed creator beta
Launch a TestFlight cohort with 200 Indian solo creators for real-world tuning.
